A painting depicting a traditional Aztec ceremony. In the center, a priest in elaborate feathered headdress and ceremonial attire stands on a platform, his arms raised in a gesture of offering or sacrifice. He holds a small object in his right hand. Below him, a vast crowd of people, mostly men in traditional tunics, looks up in awe. To the right, another figure in a detailed headdress and armor stands near a red banner with gold symbols. The background features a large, ornate pyramid with multiple levels and steps. The overall atmosphere is one of a solemn, historical event.

reinforcement learning current problems

Michal CHOVANEC, PhD.

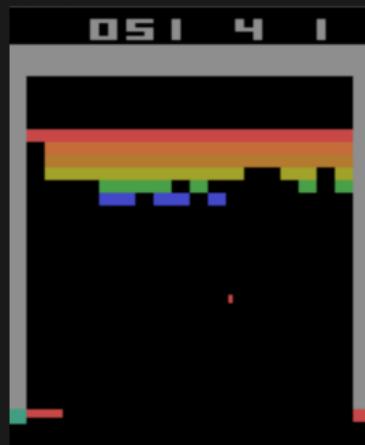

reinforcement learning

- ① **obtain state** - observation
- ② **choose action** - policy
- ③ **receive reward**
- ④ **learn from experiences**

when it works ?

- dense rewards
- small state space
- fully observable

when it works - AlphaGO, AlphaZero - DeepMind

Chess with Suren, AlphaZero's Most Astonishing "Zugzwang" Game

most famous algorithms

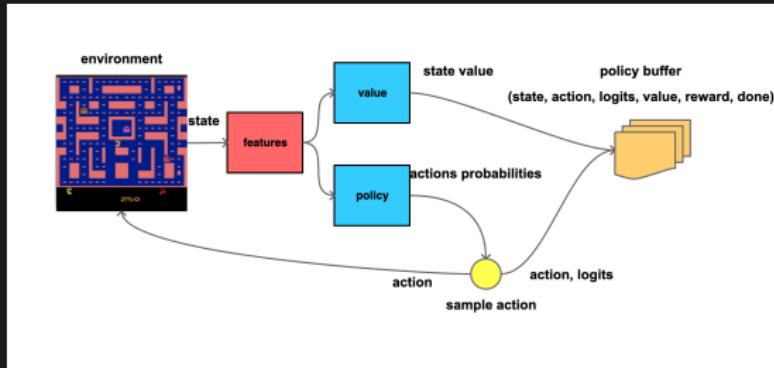

- deep Q network - **DQN**¹
- deep deterministic policy gradient - **DDPG**, D4PG²
- advantage actor critic - AC, **A2C**, A3C
- proximal policy optimization - **PPO**, TRPO³

¹Mnih et al. 2013

²Lillicrap, Hunt et al. 2016

³Schulman, et al. 2017

PPO - proximal policy optimisation

naive Actor-Critic vs PPO loss:

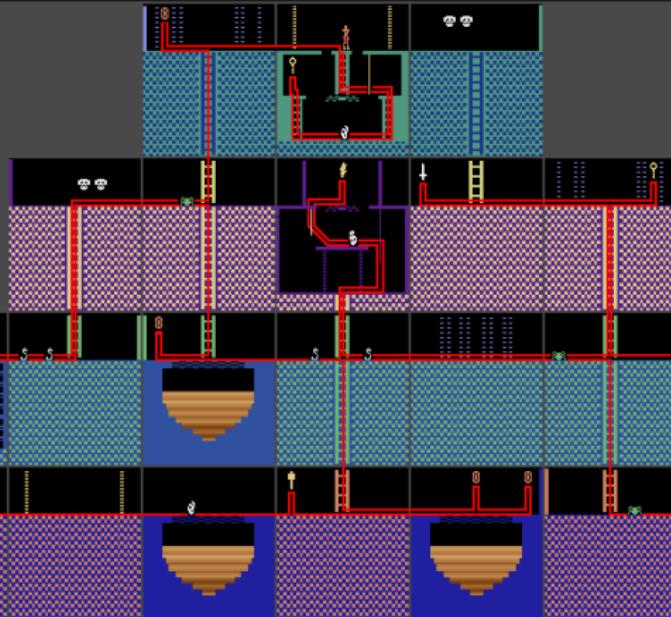

$$\mathcal{L}(\theta) = -\log \pi(a_n|s_n; \theta) \left(R(s_n, a_n) - V(s_n) \right) - \beta \mathcal{H}(\pi)$$

$$\mathcal{L}(\theta) = -\log \frac{\pi(a_n|s_n; \theta)}{\pi(a_n|s_n; \theta_{old})} \left(R(s_n, a_n) - V(s_n) \right) - \beta \mathcal{H}(\pi)$$

why so hard ?

Investigating Human Priors for Playing Video Games ⁴

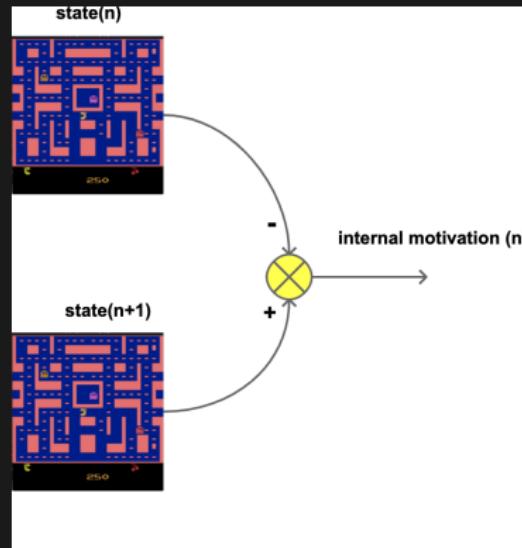

⁴Dubey et al. 2018

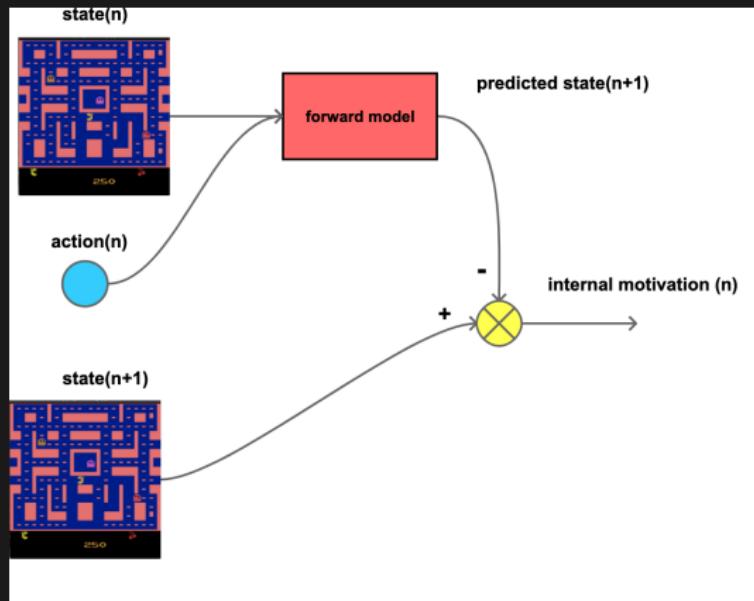

problems

- hard exploration tasks (sparse rewards)
- generalisation
- sample efficiency

pixel change motivation

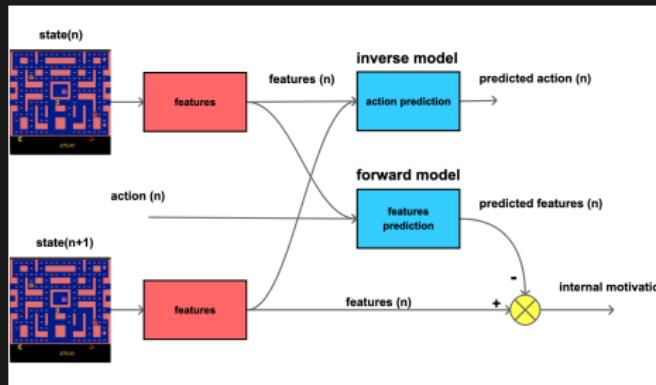

next state prediction

Curiosity-driven Exploration by Self-supervised Prediction ^a

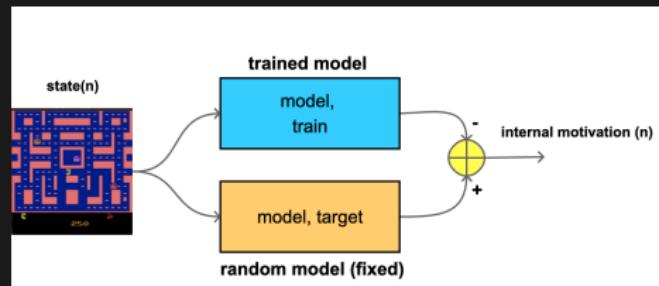

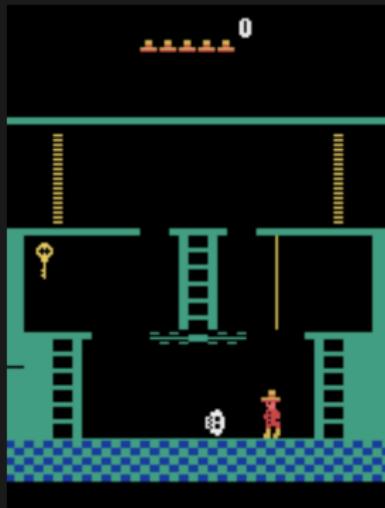

^aPathak et al. 2017

- predict **next state**, forward model
- **motivation == prediction error**
- not working ...

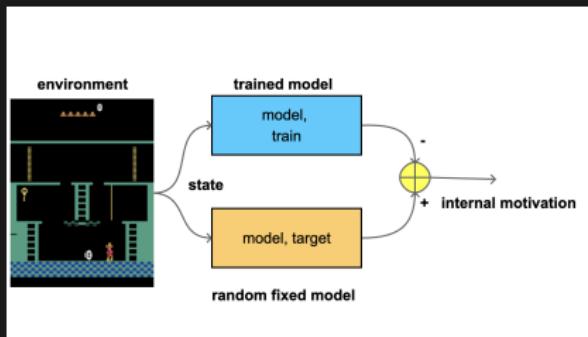

Exploration by Random Network Distillation ^a

^aBurda et al. 2018

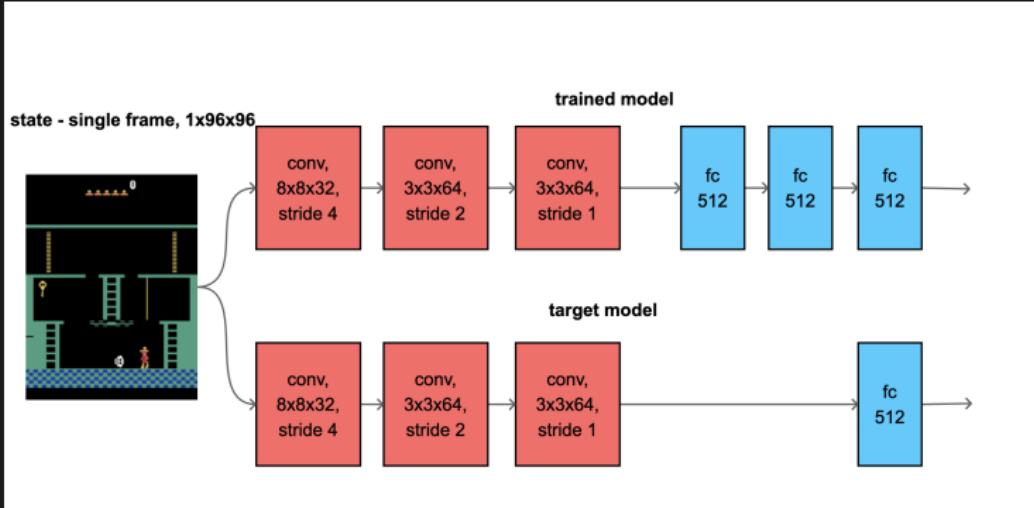

random network distillation

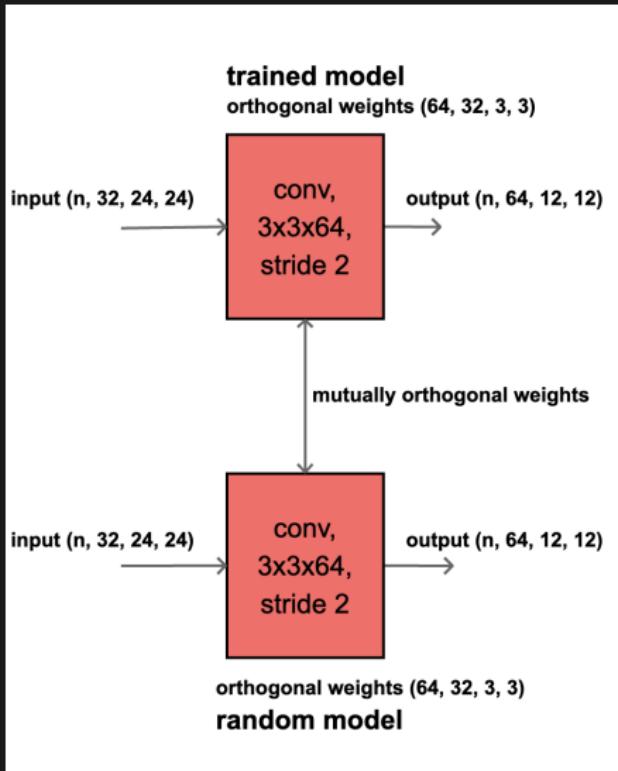

- neural network works as **novelty detector**
- model learns to imitate random (target) model
- **less visited states produce bigger motivation signal**
- orthogonal weights initialisation ($g = 2^{0.5}$) for strong signal
- lot of fully connected layers **to avoid generalisation**
- **coupled orthogonal models**

random network distillation architecture

coupled RND architecture

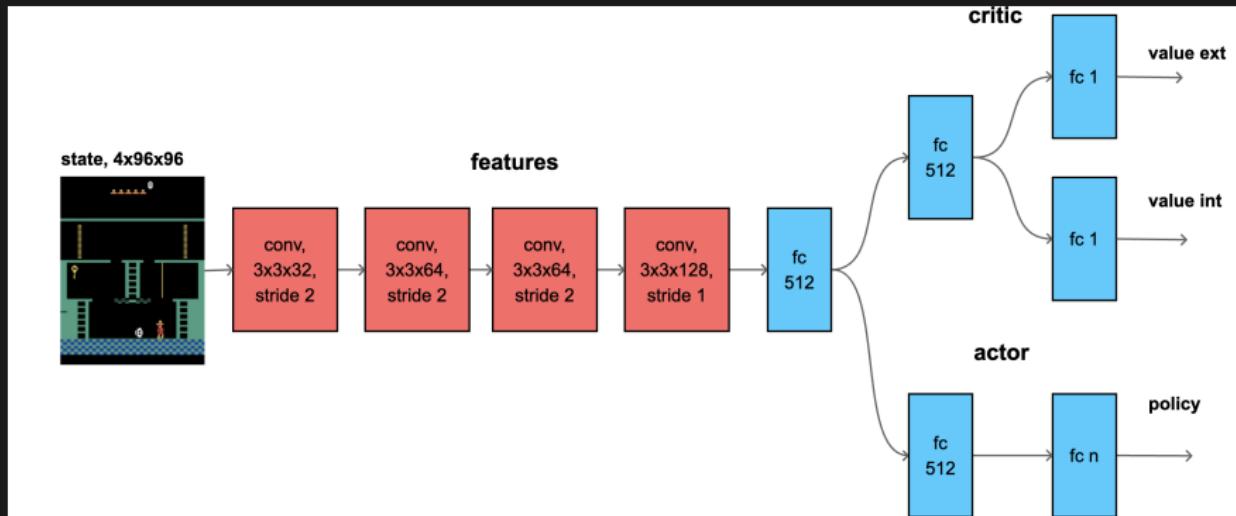

```
def coupled_orthoogonal_init(shape, gain):
    w = torch.zeros((2*shape[0], ) + shape[1:])
    torch.nn.init.orthogonal_(w, gain)

    w = w.reshape((2, ) + shape)
    return w[0], w[1]

wa, wb = coupled_orthoogonal_init((64, 32, 3, 3), 2.0**0.5)
```

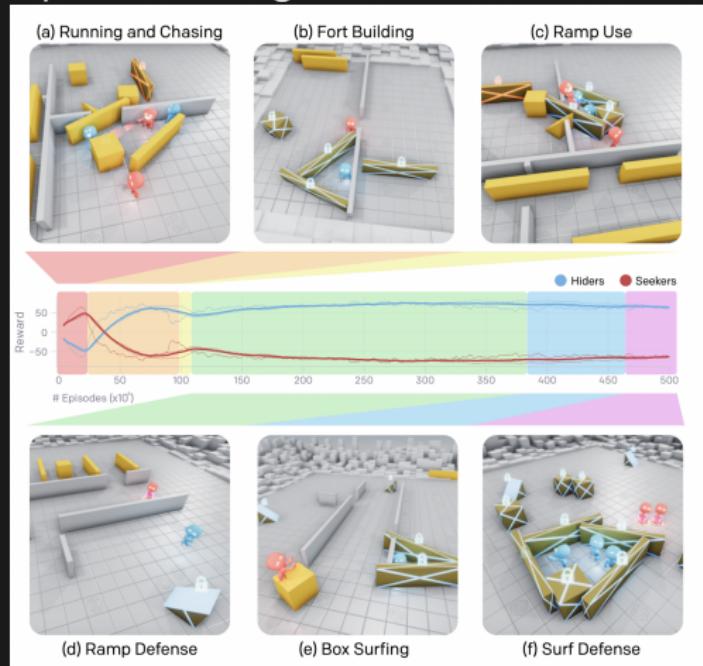

ppo model architecture

hide and seek ^a

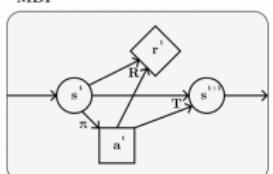

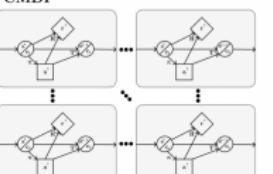

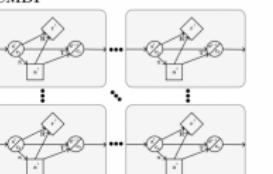

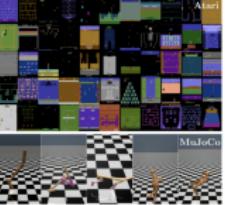

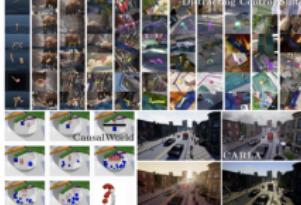

^aBaker et al. 2020

OpenAI - Emergent Tool Use from Multi-Agent Interaction

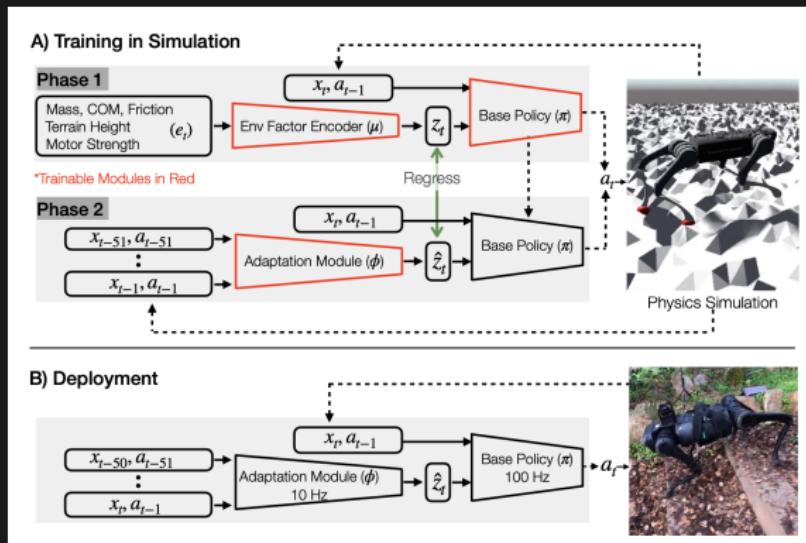

generalisation ^a

^aKirk et al. 2021

	Singleton Environments	IID Generalisation Environments	OOD Generalisation Environments
Graphical Models	 A diagram of a Markov Decision Process (MDP). It shows a state node s^i connected to an action node a^i via a transition probability π . The action node a^i leads to the next state node s^{i+1} . A reward node r^i is connected to the state node s^i , and a transition node T connects the state node s^i to the next state node s^{i+1} .	 A diagram of a Causal Markov Decision Process (CMDP). It shows two parallel causal paths from state s^i to s^{i+1} . The top path goes through an action node a^i and a transition node T . The bottom path goes through a reward node r^i and a transition node T . Both paths lead to the next state node s^{i+1} .	 A diagram of a Causal Markov Decision Process (CMDP) under Out-of-Distribution (OOD) generalisation. It shows two parallel causal paths from state s^i to s^{i+1} . The top path goes through an action node a^i and a transition node T . The bottom path goes through a reward node r^i and a transition node T . Both paths lead to the next state node s^{i+1} , but the nodes are labeled with different colors (blue and red) compared to the IID case.
Train and Test Distribution	 A diagram showing two dots, one blue and one red, side-by-side, indicating that Train = Test distribution.	 A scatter plot showing a uniform distribution of blue dots within a red rectangular boundary, representing Train Distribution = Test Distribution.	 A scatter plot showing blue dots on the left and a large red rectangle on the right, representing Train Distribution \neq Test Distribution.
Example Benchmarks	 Screenshots from the Alari and MuJoCo benchmarks, showing various environments like mazes and 3D scenes.	 Screenshots from the OpenAI Gym and Nothack environments, showing various 2D and 3D game levels.	 Screenshots from the Diving-Bot, CasualWorld, and CARLA benchmarks, showing complex 3D environments.

RMA: Rapid Motor Adaptation for Legged Robots ^a

^aKumar et al. 2021

sample efficiency

- intuitive unit **one Montezuma experiment**
 - 128M samples runs **65hours**
 - eats less than **4G memory**
 - fits **3 experiments** into single GPU (12G)
-
- RND ⁵ $4.5 * 10^9$ samples, score 8152 on MR
 - Never give up ⁶ $3.5 * 10^{10}$ samples, score 10 000 on MR
 - CND $1.28 * 10^8$ score 25 000 on MR

NGU on my machine means **740 days !!!**

⁵Burda et al. 2018

⁶Badia et al. 2020

misleading papers - Curiosity-driven Exploration by Self-supervised Prediction ^a

^aPathak et al. 2017

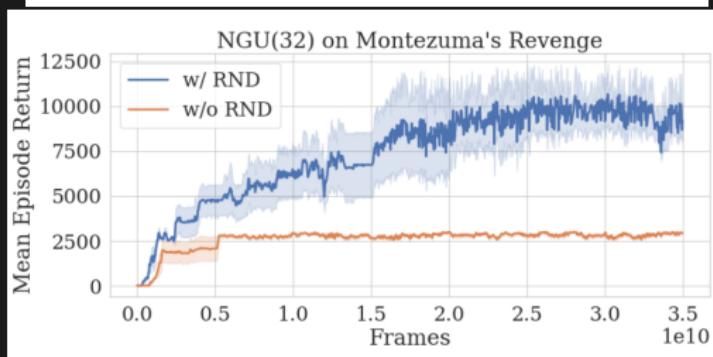

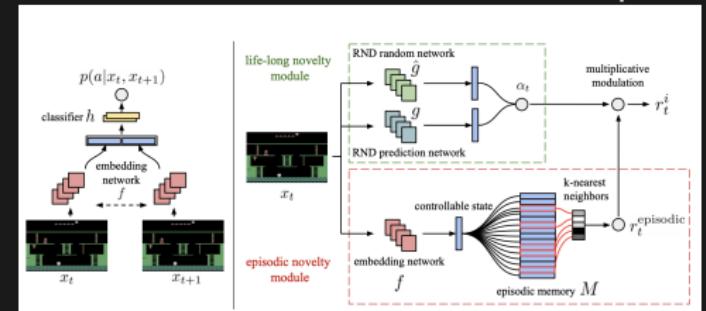

- not working on REAL hard exploration problems
- Super Mario is special case - moving forward is close to optimal policy
- inverse ICM model - why they didn't show accuracy (my results around 40% !!! even given policy)
- how predicted state looks ?

	Gravitar	Montezuma's Revenge	Pitfall!	PrivateEye	Solaris	Venture
RND	3,906	8,152	-3	8,666	3,282	1,859
PPO	3,426	2,497	0	105	3,387	0
Dynamics	3,371	400	0	33	3,246	1,712
SOTA	2,209 ¹	3,700 ²	0	15,806²	12,380¹	1,813³
Avg. Human	3,351	4,753	6,464	69,571	12,327	1,188

misleading papers - Never give up ^a

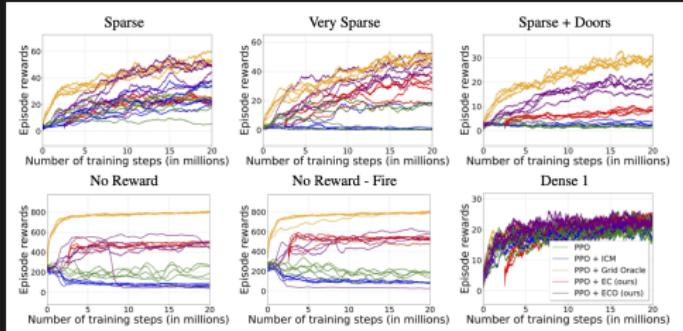

^aBadia et al. 2020

nice looking score, but on cost of $3.5 * 10^{10}$ samples !!!

other misleadings

avoiding comparing with SOTA or common benchmarks
results : Episodic Curiosity Through Reachability, Savinov, 2019

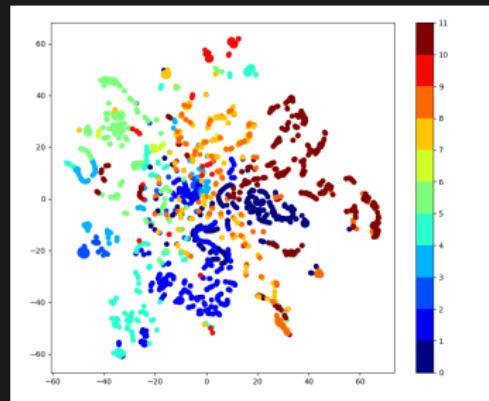

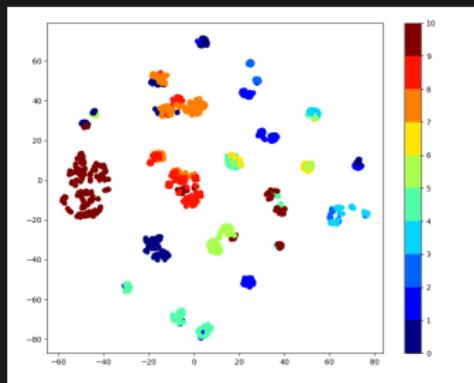

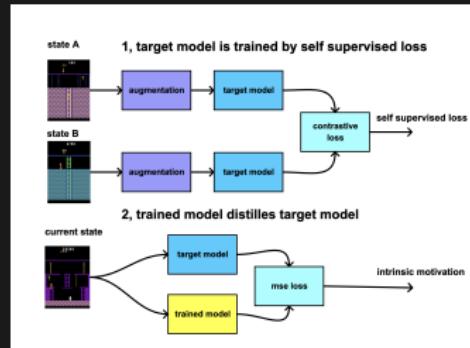

many other :

- simple gridworld or toy environment experiments
- providing key prior information (e.g. position)
- selecting only "good" results

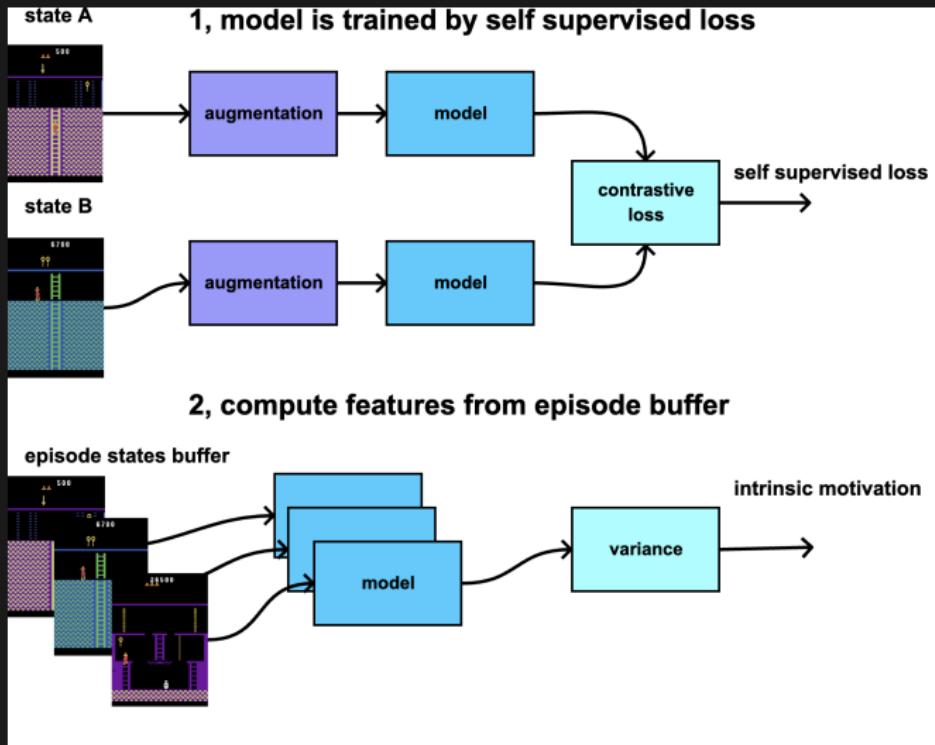

my current research

- self supervised network distillation - reached SOTA score with 1/100 samples
- raising entropy driven exploration
- symmetry driven generalisation, Noether's theorem in RL

exploration by self supervised network distillation

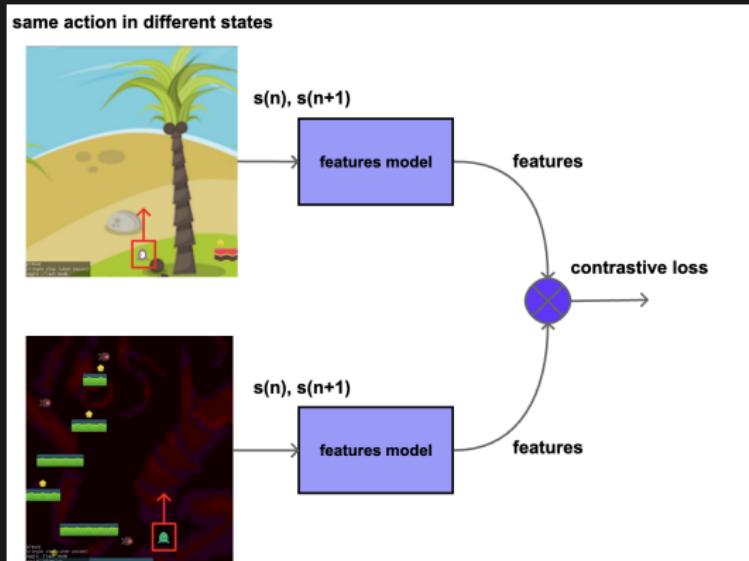

raising entropy driven exploration

symmetry driven generalisation ^a

^aBronstein et al. 2021 Geometric deep learning - some trivial hand-crafted symmetries

$$\forall(s_n, s_{n+1}|a) : f(s_n, s_{n+1}; \theta) = const_a^7$$

⁷avoid trivial collapse
